RE: Feedback on the Australia's Disability Strategy survey to examine community attitudes towards people with disability conducted by the Australian National University

Dear Minister

Thank you for the opportunity to review and provide feedback on the draft *Community attitudes towards people disability 'Have Your Say' survey report*¹ (Draft Report) examining community attitudes about people with disability that was conducted by the Australian National University as part of the Australian Disability Strategy's (ADS's) evaluation processes. Due to the limited amount of time allowed for official responses to this document, and it being a season where lots of work needs to be completed before the end of the year, Physical Disability Australia's (PDA's) contribution here is limited to general impressions of the draft report's Executive Summary, Introduction and Conclusion. What follows, then, are our thoughts on the Draft Report's descriptions of the *Have Your Say* survey's scope, intent, and headline findings.

Scope

The Draft Report's *Executive Summary* notes that researchers went to some lengths to gather responses from four groups of people: Australians in general; those who work in the 'key' health, justice and legal, education, and personal and community support industries; those with hiring responsibilities; and Australians with disability. The delineation of respondents into these categories provides researchers with the opportunity to compare three sets of attitudes of those who might have peer relationships, service provision relationships, and gatekeeping relationships with people with disability, and measure the veracity of the first three groups' stated attitudes against the lived experience of people with disability.

PDA appreciates this approach, but we would have liked to see more 'gatekeepers' included in the third cohort of respondents. In addition to those with hiring responsibilities, it would have been useful to include real estate agents/landlords and Centrelink employees as these people play significant roles in providing or denying access to housing and income, just as those with hiring responsibilities have this role with regard to employment.

PDA applauds the Draft Report's consideration of 'disability types' (the nature of each person's impairments) and disability severity (the extent to which each person's

¹ Attached as Appendix A

impairments impacts on their functional capacity). As an organisation whose mission is to represent people with disability with physical impairments, PDA appreciates the researchers' understanding that the nature of a person's impairments is a major determinant of the barriers they face in accessing all the opportunities and resources available to Australians without disability. For some time, we have been dismayed by governmental and disability sector focus on the impacts of the intersectional disadvantage people with disability may be experiencing. This has had the unfortunate effect of deprioritising the need for Australian Government disability relevant policies and programs to work at removing the impairment related barriers that **all** people with disability are challenged by. PDA acknowledges the necessity of addressing the disadvantages associated with the gender, ethnicity, age and sexuality attributes of people with disability, but it must not be the primary focus of the work.

Intent

The Draft Report's *Introduction* details how the *Have Your Say* survey was commissioned by the Department of Social Services (DSS) to measure, in part, the effectiveness of the *Australia's Disability Strategy 2021 – 2031*² (ADS). It explains that the survey, carried out in 2022, is part of a series of four to be administered and reported-on over the 10-year life of the ADS. As such, it provides a baseline assessment of community attitudes rather than a measure of the ADS's success so far. PDA, like the Australian Government, hopes that the reports from the three following surveys show significant and broad improvements the wider Australian community's (and especially key sector workers' and employers') attitudes towards people with disability that, in turn, leads to universal respect for their individual capacities and their rights to equitable access to everything Australians expect to enjoy. We think its methodology and design is fit for this purpose.

However, we feel the *Have Your Say* survey is too narrowly focussed on the "Community Attitudes" ADS 'Outcomes Area'; one of seven specified and detailed in *Outcomes Framework*³ document. This misses an opportunity to look into, and relate the broader experiences (in the Outcomes Areas of 'Employment and Financial Security', 'Inclusive Homes and Communities', 'Safety Rights and Justice', 'Personal and Community Support', 'Education and Learning', and 'Health and Wellbeing') of the respondents with disability to the attitudes of key sector workers being surveyed at the same point-in-time. This is baffling given the researchers understand that the attitudes of all Australians towards people with disability are "important in improving the lives of people with disability, as [they] influence a range of other outcomes such as employment prospects, educational attainment and health."

Headline Findings

From PDA's perspective, the most significant finding was presented in first part of the draft report's *Executive Summary*:

...overall, most Australians report having fairly positive attitudes to people with disability. However, a closer look at the data showed that attitudes were less positive overall and varied significantly between types of disability.

² This and its subsidiary documents are published on the *Disability Gateway* website (www.disabilitygateway.gov.au/ads/strategy)

³ <https://www.disabilitygateway.gov.au/node/3121>

As stated above, PDA is grateful the researchers understand that the nature of a person with disability's impairments is a major determinant of the barriers they face in accessing all the opportunities and resources available to Australians without disability. We hope DSS, and the Australian Government as a whole, accepts this finding and adopts the practice of acknowledging the advice of impairment focused member organisations of the Disability Representative Organisations (DRO) Program as being on an equal footing as that they receive from population focused DROs⁴

The draft report's *Conclusion* provides many statistical results about the attitudes of Australians in general; those who worked in the health, justice and legal, education, and personal and community support industries; those with hiring responsibilities and the experiences of Australians with disability attributable to the range of attitudes directed towards them. Many of these were unsurprising to PDA.

Our summary of the draft report's findings is that Australians without disability say they have good attitudes towards people with disability, but their behavioural choices (derived from answers questions as to how they would react in certain scenarios – called *vignettes* by the researchers) suggests otherwise:

...when asked how comfortable they [would feel] with a close relative being in a relationship with someone with disability, [the proportion of] respondents who were 'very comfortable' [about such a prospect] ranged from 47.1% for [someone with a] physical disability down to 23.3% for [someone with a] psychosocial disability.

... when asked if people with disability should be able to access the same range of fertility or family planning services as people without disability, [the proportion of] health sector workers who 'strongly agreed' [with the principle of equitable access] ranged from 83.2% for [a patient with] physical disability down to 33.5% for [a patient with] intellectual disability.

86.6% of [respondents] with hiring responsibilities reported that hiring people with disability [would] benefit their workplace and 92.5% agreed that hiring people with disability would make a valuable contribution to their workplace. However, only 14.6% [of these respondents] had hired someone with a disability in the last 12 months, 15.0% had done so but more than a year ago and 70.3% had never been involved in hiring someone with a disability.

None of the draft report's sections that we have analysed make any recommendations apart from: that further analysis of the survey's response data be done to identify any demographic and intersectional factors at play in Australians'

⁴ For some time now DSS has disproportionately solicited the advice of population focused DROs (advocating on behalf of women, CALD, First Nations, Children and *all* people with disability) above that which they might receive from impairment focused DROs (advocating for people with disability who experience disadvantage specifically related to their physical, sensory, intellectual, psychosocial, and neurodiverse impairments). This is clearly evidenced by past and current DRO funding arrangements, and DSS' decision to limit the scope of the National Coordination Function (NCF) responsibilities such that the NCF provider is not required to include all DRO Program members in all aspects of its work.

attitude formation processes; and that thought be given to “what can be done to change attitudes”. PDA agrees.

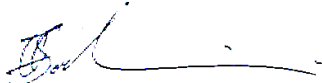

The draft report’s findings, while being consistent with PDA’s expectations, should be a cause for great concern to those responsible for delivering the ADS’s Vision – “an inclusive Australian society that ensures people with disability can fulfil their potential, as equal members of the community.”

In Conclusion

PDA’s recommendation is that the ADS’s administrators involve people with disability and **all** their national peak representative organisations in a thorough review and codesigned update of the ADS’s *Targeted Action Plans* so that each of them plays a part in convincing **all** Australians (especially key sector workers and employers) that **all** people with disability are worthy of respect and equitable access to the nation’s social, cultural, economic, and environmental resources regardless of their impairments and intersectional attributes.

We thank you again for the opportunity to review and comment on the *Have Your Say* survey’s Draft Report, and hope you find this brief analysis of it informative and compelling.

Yours Sincerely

Andrew Fairbairn

About Us:

Physical Disability Australia (PDA) is a national peak membership-based representative organisation run by people with physical disability for people with physical disability. PDA was founded in 1995 and have over 1,200 members from all Australian States and Territories. Our purpose is to:

- Remove barriers through systematic advocacy to all levels of government to enable every Australian living with a physical disability opportunities to realise their full potential;
- Proactively embrace and promote difference and diversity for an inclusive society; and
- Actively promote of the rights, responsibilities, issues and participation of Australians with physical disability.

Acknowledgements

The authors thank the Australian Government Department of Social Services for funding this important research project and for their support throughout. We also acknowledge the input from Disability Representative Organisations (DROs) and people with disability.

The Social Research Centre supported the development of the survey, undertook the data collection and processing and technical reporting.

JFA Purple Orange played an important role in facilitating the co-design groups that informed the design of the survey and conducting the focus groups for the nested study with people living with intellectual disability.

DRAFT

We know that current community attitudes towards people with disability are not good. We know from the studies that ... people with disabilities are viewed as sometimes not having a meaningful role in society.

Dr Ben Gauntlett¹, former Disability Discrimination Commissioner

It's important to understand that people with the lived experience of Down syndrome or other intellectual disabilities, they know how much they can do. And it's only through listening to that ... and they have to recognise that we are all unique.²

Executive summary

It has long been understood that the attitudes of society towards people with disability have a major impact on their wellbeing. In recognition of this, *Australia's Disability Strategy 2021–31* (ADS) includes, as one of seven outcome areas, Community Attitudes. In order to provide data on community attitudes towards people with disability, the Australian Government has funded the ADS Survey – *Share with us*, a longitudinal survey on attitudes towards people with disability.

The survey collects information on attitudes in the general community, from workers in four key sectors (health, justice and legal, education and personal and community support) and from people with hiring responsibilities. It also explores how people with disability are affected by the attitudes and behaviours of others and the extent to which attitudes can be both enablers and barriers to inclusion.

This report provides some of the key findings from the first wave of the ADS Survey conducted in 2022. It shows that, overall, most Australians report having fairly positive attitudes to people with disability. However, a closer look at the data showed that attitudes were less positive overall and varied significantly between types of disability. Also, the extent to which people with disability were affected by others' attitudes varied significantly by both the type and the severity of their disability.

People who have experiences living with people with disability generally had more positive attitudes than people without that experience. This was supported by the findings related to workers in the four key sectors and their levels of *confidence* in their *ability* to advise, assist or treat people with different categories of disability. Those who live with people with disability most frequently had the highest levels of confidence.

Most respondents with hiring responsibilities reported that hiring people with disability benefits their workplace and that hiring people with disability would make a valuable contribution to their workplace. However, only a minority had hired someone with a disability in the last 12 months and the majority had never employed anyone with a disability. The employment experience of people with disability demonstrates that there is room for significant improvement.

People living with disability were asked if other people's attitudes or behaviours ever stopped them from accessing or undertaking various activities. While the majority reported 'hardly ever' or 'never' across all the activities, the severity and the type of the disability both had a significant impact on access. For example, accessing education was the least affected by other peoples' attitudes or behaviours, with around 1 in 5 responding that they had been stopped from accessing education always, often or sometimes, but this ranged from 1 in 10 people with mild disability to almost 4 in 10 with severe disability. The disability types affected by the attitudes of others always or often were speech, intellectual and learning impairments and brain injury.

Other peoples' attitudes and behaviours had a greater impact on respondents attending community events. Overall, almost a third reported feeling deterred always, often or sometimes. Again, this ranged from about 1 in 5 people with mild disability to more than half of respondents with severe disability. Well over half of respondents with disability felt valued and respected and welcomed by and included in their community. However, severity was once again a major factor. Finally, respondents with disability were asked if people with disability are well represented in various spheres of life such as in leadership roles, the

workplace, community and in the media. Positive responses ranged from almost a half feeling well represented in the community down to less than 1 in 5 feeling represented in leadership roles.

DRAFT

1 Introduction

It has long been understood that the attitudes of society towards people with disability have a major impact on their wellbeing (Thompson et al. 2011). In recognition of this, *Australia's Disability Strategy 2021–31* (ADS) includes, as one of seven outcome areas, community attitudes. The community attitudes outcome area is important in improving the lives of people with disability, as it influences a range of other outcomes such as employment prospects, educational attainment and health.

Extensive consultation with the disability sector during the development of ADS suggested that changing attitudes will lead to better support, improved treatment and more respect for people with disability.

The Royal Commission into Violence, Abuse, Neglect and Exploitation of People with Disability (the Disability Royal Commission) notes in their final report in '*Our vision for an inclusive Australia*', people with disability encounter negative attitudes and discriminatory behaviours throughout their lives. 'Ableism' is the word most commonly used to describe the attitudes that motivate harmful behaviours directed at people with disability.³ The word pinpoints attitudes that perpetuate the idea that people with disability are different from, less than and inferior to people without disability, incapable of exercising choice and control, and a burden on society.⁴ Ableism leads to low expectations of people with disability. In the context of education for example, the attitudes of teachers and principals towards students with disability are key determinants of students' success in the education system.⁵

This makes it important to gain a more nuanced understanding of attitudes, reasons people hold these attitudes and any structural factors that prevent (or constrain) positive change. The ADS Survey – *Share with us 2022* has been commissioned and funded by the Australian Government Department of Social Services (DSS) in order to measure changes in community attitudes over time.

The ADS Survey explores the attitudes of the general community, people working in particular sectors and people who make hiring decisions. It also describes how people with disability are affected by the attitudes and behaviours of others and the extent to which attitudes can be both enablers and barriers to inclusion. The longitudinal design of the survey will enable identification of the factors associated with changes over time in attitudes at the individual person level. Four waves will be conducted over the life of ADS.

To inform the development of the ADS Survey, the ANU Centre for Social Research and Methods was commissioned to develop a methodology and survey instrument, which was required to:

⁴ Submissions of Counsel Assisting the Royal Commission following Public hearing 31, 3 February 2023, pp 7–8 [5]; Shane Clifton, Hierarchies of power: Disability theories and models and their implications for violence against, and abuse, neglect, and exploitation of people with disability, Report prepared for the Royal Commission into Violence, Abuse, Neglect and Exploitation of People with Disability, October 2020, pp 15–16.

⁵ Submissions of Counsel Assisting the Royal Commission following Public hearing 24, 21 October 2022, p 142 [385].

- provide robust data on the attitudes of workers from the four sectors (personal and community support, education, justice and legal and health), among people with responsibility for making hiring decisions and the general community
- provide robust data on the experiences of people with disability in engaging with workers in these sectors
- be able to be repeated on a regular basis in order to provide reliable estimates of changes in attitudes of workers and employers and of changes in the experiences of people with disability
- allow statistically reliable estimates of differences in attitudes and changes in attitudes for each state and territory
- ensure inclusion in the survey of people with a disability from rural, remote, and urban communities and intersectionality cohorts such as Aboriginal and Torres Strait Islander people, Culturally and Linguistically Diverse and LGBTIQ+.

This report provides early findings from the baseline (Wave 1) data. Further analysis will be conducted to explore different aspects of the data.

2 Background

2.1 Australia's Disability Strategy 2021–2031

ADS is the overarching policy framework that is designed to provide national leadership towards greater inclusion of people with disability across all areas of public policy. It sets out practical changes Australia can make to improve the lives of people with disability.

The ADS includes seven Outcome Areas:

- employment and financial security
- inclusive homes and communities
- safety, rights and justice
- personal and community support
- education and learning
- health and wellbeing
- community attitudes.

As part of the development of the ADS, DSS conducted consultations across Australia. As a result of those consultations, it was decided to add a seventh Outcome Area, community attitudes, in addition to those in the *National Disability Strategy 2010–2020*. An Outcomes Framework which is designed to measure, track and report on how things are changing for people with disability across the life of the ADS has been established. The main source of data for the community attitudes Outcomes Area is the ADS Survey.

2.2 The importance of attitudes of society towards people with disability

Thompson et al. (2011:9) identified three types of attitudes held by people without disability towards people with disability. The first attitude is inclusive. That is, people without disability have an awareness of, and a willingness to engage with, people with disability. The second attitude is characterised by a lack of awareness of people with disability, the difficulties they face, their personal support requirements and life ambitions. The third attitude is one of discomfort with the 'otherness' of people with disability.

However, the discomfort associated with 'otherness' (psychosocial disabilities) and lack of competence (intellectual or developmental disabilities) can be overcome through personal contact, particularly when the person with disability is perceived as credible, relatable and of equal or higher status (Randle & Reis 2020:6). The effects of having experience with people with disability are explored in this report.

The *Survey of Community Attitudes toward People with Disability* (DHHS 2018) (Survey of Community Attitudes) presented the findings of a survey designed to provide a baseline understanding of attitudes for Victoria's *State Disability Plan (2017–2020)*. The survey included 1,000 participants from greater Melbourne and the rest of Victoria and explored dimensions of attitudes relating to beliefs and stereotypes, rights and entitlements, discrimination and social exclusion and attitudes at work and at school. In Phase 2, the survey included respondents from all over Australia.

The DHHS survey and subsequent work has identified that attitudes can differ according to both the nature and the severity of the disability. In 2020, Randle and Reis (2020:13) noted that, while community attitudes toward the inclusion of people with disability are generally positive, levels of discomfort or anxiety are more likely to emerge when a disability is perceived to be more severe.

People living with a physical disability experience the least stigma (Randle & Reis 2020:6, 17; DHHS 2018:28). For example, in an ACT Disability Advisory Council study, 'the overwhelming response was that people with a physical disability or sensory impairments were more able to make a valuable contribution than people with intellectual or psychiatric disability' (Thompson et al. 2011:12).

3 Methodology

This section provides a summary of the methodology used for the ADS Survey. A detailed description of the methodology is provided in Australia's Disability Strategy Survey Technical Report (Social Research Centre 2023). The underlying data used in this report is available to approved users for download via the Australian Data Archive ([ADA | Australian Data Archive](#)).

3.1 Overview

The ADS Survey was designed to produce nationally representative data for the population aged 18 years or older living in private dwellings. The ADS Survey was required to provide data for the Australian population as a whole as well as for a number of groups including: people with disability, people with responsibility for making employment/hiring decisions, and people working in the specific sectors: education, health, personal and community support and justice and legal.

The Australia and New Zealand Standard Industrial Classification (ANZSIC) system classifies entities based on their main business activity and is used to collect and analyse data across industries. We used several items from this system to identify if respondents who were working were from one of the key sectors. Section E (Screening) included:

Do you work in any of these industries?

*Please select **one** only. If you work in more than one industry, please select the **main** one.*

1. **Health care** – e.g., hospitals, doctors and dentists, pathology, medical imaging, optometrists, allied and other health services (such as physiotherapy, homeopathy, psychology), ambulances
2. **Residential care** – e.g., aged care, hospices, crisis care, group homes
3. **Social or community services** – e.g., adult day care, disability assistance services, youth welfare, family support and counselling
4. **Legal services** – e.g., barristers and solicitors, conveyancing, legal aid, courts
5. **Public order and safety** – e.g., police, gaols, correctional centres, juvenile detention, remand centres
6. **Education** – e.g., child care, preschools, primary, secondary and special schools, technical and vocational education, universities and other higher education institutions, adult education, community education

We then combined Residential care and Social or community services to identify the **Personal and Community Support Services Sector** workers and we combined legal services with public order and safety to identify the **Justice and Legal Sector** workers. Results are reported based on those four key sectors throughout the report, except for a couple of occasions where there were very significant differences in the experience of people living with disability, for example between legal services and public order and safety.

The target number of respondents to the survey was approximately 21,500. While this was recognised as more than would typically be required for a general population survey, this size was recommended to achieve sufficient numbers for analysis in the specific key groups. Based on the estimated yield of 20%, the selected sample size was 107,500 addresses.

Estimates associated with the yield within each of the key groups assumed the sample would fall out exactly in proportion to population with respect to disability (National Health Survey disability items), sector and hiring responsibilities. It was acknowledged that actual response rates from each of these groups would likely vary, and responses to Wave 1 were closely monitored for this reason.

The survey was designed as an address-based sampling (A-BS) push-to-web, offering online and hard copy completion modes.⁶ The response rate from this approach was lower than initially expected and, once survey yields were analysed, it was evident targets would not be met.

⁶ The sampling frame for the address-based sample is the Geo-coded National Address File (G-NAF). The 'square root allocation' sample selection method was preferred to an equal or probability-proportionate to size selection approach as a means of increasing the achieved sample sizes in smaller states, improving the bases for state-level reporting. Using this approach, States and Territories which normally achieve fewer completions (either due to smaller populations and / or lower sample yields) were over-sampled to reflect more of the final number of completes than they would otherwise.

Accordingly, the decision was made to supplement the sample by running the survey on the January 2023 wave of Life in Australia™, a probability-based online panel of Australians. All online panellists were approached, with a target of up to 5,000 additional completes. As well as boosting the overall sample size using a robust methodology, conducting the Survey on Life in Australia™ allowed us to obtain results from respondents without the potential influence of topic salience, to allow for a comparison of national estimates achieved from each frame.

Table 1 shows the total number of respondents to the survey as well as from the A-BS and from the Life in Australia™ sample. Table 1 also shows the numbers of respondents in each of the key industry groups and those with hiring responsibilities. The total number of respondents is 18,188, with 13,459 from the address-based sample and 4,729 from the Life in Australia™ panel.

Table 1 Numbers of respondents (Unweighted)

		Total	Address-based sample		Life-in-Australia
			Online	Hard-copy	
Total (no.)		18,188	9,664	3,795	4,729
Industry					
Health	No.	1,552	897	286	369
	% of total	8.5	9.3	7.5	7.8
Personal and Community Support	No.	867	529	145	194
	% of total	4.8	5.5	3.8	4.1
Justice and Legal	No.	352	192	51	109
	% of total	1.9	2.0	1.3	2.3
Education	No.	1,646	998	248	402
	% of total	9.0	10.3	6.5	8.5
Involved in hiring employees in past 12 months	No.	2,474	1,459	421	586
	% of total	13.6	15.1	11.1	12.4

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

The initial survey response rate achieved through A-BS was 15.2% of households that were eligible to participate in the survey. The survey over-represents people living with disability due to the response rate for people with disability being higher than the overall response rate. While we are not able to definitely determine why this is the case, our judgement is that, because the approach letter specifically mentioned that the survey was about disability, those with disability may have seen the survey as more relevant to themselves than those without disability.

3.2 Accessibility of the survey

While the ADS Survey was a population-based survey, we endeavoured to make it accessible to people with disability and people from culturally and linguistically diverse

backgrounds. Some of the key elements of accessibility included an online platform that adheres to the Web Content Accessibility Guidelines version 2.0 AAA⁷, the availability of Computer Assisted Telephone surveying, Easy English version of the questionnaire and translations into five other languages. Publishing the questionnaire in an Easy English format made it accessible to a wider audience, including people with disability, First Nations people, culturally and linguistically diverse people, and people of all ages with low levels of literacy. Overall, 404 respondents (3.0% of participants in the main survey) completed the survey online using the Easy English version of the survey.

To improve the representation of people from a non-English speaking background, the online survey and supporting information were translated into five languages other than English: Arabic, Korean, Simplified Chinese, Traditional Chinese and Vietnamese. Overall, 1.3% of respondents participated in the survey using a translated version of the online survey. This comprised: 89 who completed in Simplified Chinese; 42 who completed in Traditional Chinese; 24 who completed in Korean; 11 who completed in Vietnamese; and 4 who completed in Arabic.

With accessibility a priority for the ADS Survey, an interviewer-assisted completion mode was also offered, whereby respondents could call in to the helpdesk and interviewers would complete the online survey on their behalf. Overall, 42 respondents took up the option of completing the survey using the telephone-assisted approach.

The Survey was designed to provide a high-quality sample of the general population, of sufficient size to allow for analysis within the key groups. It was adapted for the Life in Australia™ infrastructure and data was readily combined.

3.3 Respondent profiles

The data are weighted to adjust for differences in the likelihood of being selected to participate in the survey due to the sampling and design and difference in the response rates amongst different population groups.⁸ The weighted data are used throughout this report to give population-level estimates of results. However, both the unweighted and weighted versions of the respondent profiles have been provided here.

3.3.1 Unweighted sample

In the unweighted sample, the total number of respondents was 18,188. The proportion of women was 62.2% (11,287) and the proportion of men was 37.2% (6,746). The highest proportions of respondents were in the age brackets 65-74 (21.7%), 55-64 (19.5%) and 45-54 (14.8%).

The five largest states had sufficient respondents for interstate comparisons, ranging from 4,420 (24.3%) from New South Wales to 1,847 (10.2%) from South Australia. However,

⁷ Our design is informed by the online inclusive design and legibility considerations available through Vision Australia.

⁸ The weighting is complicated because the total survey respondents are drawn from two probability samples. The approach taken is to construct weights for each sample with weights within each sample adding to the total Australian population aged 18 years and older. When combining the two samples, weights are scaled to sample sizes before files are combined. This gives weight to each sample based on its size, thus combining the two without over-representation of respondents from one sample. This approach is justified by the probability-based frames of both samples, along with the existence of quantifiable base weights and an assumed small overlap in samples (Social Research Centre 2023).

Tasmania and the two territories had samples between 1,056 (5.8%) from Tasmania and 725 (3.9%) from the Northern Territory.

In terms of the key sectors, 4,417 employed respondents identified as working in one of the four key sectors (42.7%). More specifically, there were 1,646 in education sector, 1,552 in health care, 867 in personal and community support (259 in residential care and 608 in social or community services) and 352 in justice and legal (214 in legal services and 138 in public order and safety). Furthermore, of those employed, 2,470 (24%) had hiring responsibilities.

The sample consisted of 9,590 people with disability (53.2%) and 8,432 people without disability (46.8%) and there were some differences in the demographic characteristics of the two groups. The proportion of females with disability was 60.87% and the proportion of males with disability was 38.1%. In terms of age, those with a disability were older than those without a disability. More specifically, the average age of a respondent with disability was 58 and the average age of a respondent without disability was 49.

Furthermore, more people without disability had bachelor degrees or higher (58.3%) relative to those with disability (44.4%) and higher levels of income relative to those without disability. In terms of sectors, the highest proportion of those with disability worked in the education sector (37%) and the lowest proportion worked in the justice and legal sector (8.3%). The highest proportion of those without disability worked in the health care sector (37.3%) and lowest proportion worked in justice and legal sector (7.7%). A complete respondent profile of the unweighted sample is presented in Appendix Table 1A.

3.3.2 *Weighted sample*

The weighted number of respondents was 18,188 with fairly equal numbers of men and women and all states and territories represented. The highest response rates were in the age brackets 25–34 (18.4%), 35–44 (17.7%) and 45–54 (16.2%).

The five largest states had sufficient respondents for interstate comparisons, ranging from 5,712 (31.4%) from New South Wales to 1,297 (7.1%) from South Australia. However, Tasmania and the two territories had samples between 409 (2.3%) from Tasmania and 169 (0.9%) from the Northern Territory.

In terms of the key groups, 4,153 of those employed (34.7%) identified as working in one of the four key sectors, ranging from 1,458 in education, to 1,356 in health care, 952 in personal and community support (318 in residential care and 633 in social or community services) and 388 in justice and legal (236 in legal services and 152 in public order and safety). Of 11,954 employed respondents, 21.7% had hiring responsibilities.

The weighted sample consisted of 6,553 people with disability (36.3%) and 11,503 people without disability (63.7%). In terms of demographic differences, more men (51.6%) than woman (46.5%) with disability responded and respondents with disability were generally older than those without disability. The mean age of those with and without disability was 51 and 44, respectively.

Almost twice as many people without disability (39.9%) had bachelor degrees or higher than people with disability (21%) and, generally, people without disability had higher incomes than people with disability. In 2018, the median gross income for a person with disability aged 15 to 64 years was \$505 per week, less than half the \$1,016 per week median gross income of a person without disability (ABS 2018).

Of those who work in the key sectors, people with disability were more likely to work in the personal and community support sector, but less likely to work in the health sector. A complete respondent profile of the weighted sample is presented in the Appendix Table 2A.

The weighted sample is used for the remainder of the report. The underlying data used in this report is available to approved users for download via the Australian Data Archive (<https://ada.edu.au/>:10:80408/FKTC2N).

4 Community perceptions of disability and attitudes

The ADS Survey explored both what people regard as disability and their attitudes towards people with disability. It is challenging to measure people's attitudes towards people living with disability because there are different dimensions of attitudes and because people may give answers that they think will make them look better (which introduces social desirability bias).

Therefore, the ADS Survey included several sections about attitudes towards people living with disability. In addition to the Power scale described in detail in Section 4.2, there were also a number of vignettes designed to elicit a more nuanced understanding of attitudes and targeted at different groups within the sample. These were developed in close consultation with people with disability through co-design.

In addition, there were modules specifically for people with disability about their experiences of other people's attitudes and for people with hiring responsibilities. Overall, responses to the Power scale were more positive than those elicited in other ways, which may reflect social desirability bias among respondents. It is also clear that the experience of people living with disability and the impact on them of other people's attitudes is even less positive.

4.1 Understanding of disability

The United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) defines disability as 'long-term physical, mental, intellectual or sensory impairments which in interaction with various barriers may hinder their full and effective participation in society on an equal basis with others' (United Nations 2006).

The National Health Survey (NHS) is conducted by the Australian Bureau of Statistics (ABS) every three years and assesses disability according to type of condition, duration (has lasted or is likely to last more than six months) and whether/how often people need help or supervision with key tasks (self-care, mobility and communication). The survey questions about whether the respondent has a disability and, if so, the nature of disability are based on the NHS questions. However, it appears from responses to the perception questions that many people have a much less strict understanding of what constitutes a disability.

In the ADS Survey, respondents are asked which of a number of conditions they see as a disability. The list of conditions that respondents were asked about included conditions that would be classified as a disability (such as blindness or Down Syndrome) and conditions that would not generally be classified as a disability under the UNCRPD definition or by the ABS NHS definition (such as a broken leg).

Table 2 shows that the conditions which the highest proportion of the Australian population see as a disability were: Blindness (89.7%), Down syndrome (84.6%) and severe arthritis (80.7%). These are all conditions which would generally be classified as being a disability. HIV/AIDS was seen as disability by the lowest proportion of the Australians (37.7%). One

of the more surprising findings was that over one-half the respondents (51%) classed a broken leg as a disability, in spite of it being temporary. This indicates some lack of clarity in Australians' understanding of what conditions would generally be classified as a disability.

Across most of the conditions listed, more people with disability regarded the conditions as a disability, but significantly more people with disability saw chronic pain and extreme fatigue as a disability (Appendix Table 3A). Similarly, more people with experience with people with disability regarded all the conditions as disability than those without experience (Appendix Table 4A).

Table 2 Australians' perceptions of what is a disability

Condition	Think a person with this condition has a disability (%)
Has HIV/AIDS	31.7
Has severe arthritis	80.7
Is blind	89.7
Has a broken leg and uses crutches while it heals	51.1
Has cancer	46.5
Has a diagnosis of depression	57.3
Has Down syndrome	84.6
Has a severe facial disfigurement	51.0
Has extreme fatigue or tiredness	59.5
Has chronic pain	75.6

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

4.2 Attitudes towards people with disability

The *Attitudes to Disability Scale* developed by the World Health Organization (WHO) Quality of Life Group (the Power scale) is widely used in surveys and was included in the ADS Survey (Power et al. 2010). The scale asks respondents to indicate whether they strongly agree, agree, neither agree nor disagree, disagree or strongly disagree with 20 statements related to the perception of the functioning of people with disability in society. The 20 statements relate to five domains:

1. Inclusion – Relationships, involvement, burden to society, burden to family
2. Discrimination – Ridicule, exploitation, irritation, ignorance
3. Gains – Emotional strength, maturity, achievement, determination
4. Prospects – Sexuality, underestimation, optimism, future prospects
5. Work – Company image, willingness to work, efficiency, support at work.

The Power scale (with slightly simplified language) as it appeared in the ADS Survey is shown in Box 1.

Box 1. Power scale questions

Please indicate how much you agree or disagree with the following statements...?

Please select an answer for each.

Inclusion

- a) People with disability find it harder than others to make new friends
- b) People with disability have a hard time getting involved in society
- c) People with disability are a burden on society
- d) People with disability are a burden on their family

Discrimination

- e) People often make fun of disability
- f) People with disability are easier to take advantage of (exploit or treat badly) compared with other people
- g) People tend to become impatient with those with disability
- h) People tend to treat those with disability as if they have no feelings

Gains

- i) Having a disability can make someone a stronger person
- j) Having a disability can make someone a wiser person
- k) Some people achieve more because of their disability (e.g., they are more successful)
- l) People with disability are more determined to reach their goals

Prospects

- m) Sex should not be discussed with people with disability
- n) People should not expect too much from those with disability
- o) People with disability should not be optimistic (hopeful) about their future
- p) People with disability have less to look forward to than others

Work

- q) Employing people with disability improves a company's image
- r) People with disability do not want to work, they do not look for a job
- s) People with disability work less efficiently than people without any disability
- t) It is easier for people with disability to do their job if they have the right support and equipment at work

(RESPONSE CATEGORIES)

- 1. Strongly agree
- 2. Agree
- 3. Neither agree nor disagree
- 4. Disagree
- 5. Strongly disagree

The statements vary, with some worded positively and some negatively. This means that for positively worded statements, agreement indicates a more positive attitude towards people with disability and for negatively worded statements, agreement indicates a less positive attitude. The statements are combined into five domains by reversing the coding on negatively framed items so that, for all domains, agreement indicates a more positive attitude toward people with disability. The mean attitude for each domain was then

calculated based on a 1–5 scale. Number 1 represents strongly negative attitudes and Number 5 represents strongly positive attitudes.

While the Power scale statements are designed to be combined into the five domains and the overall scale in order to provide robust measures of attitudes toward people with disability, the responses to the individual items do provide some interesting insights into Australian's attitudes towards people with disability. Table 3 shows the extent of agreement or disagreement with each statement.

- More than half of respondents agreed that people with disability find it harder than others to make new friends and have a hard time getting involved in society.
- Only 6% agreed that people with disability are a burden on society, but 17% agreed that they are a burden on their families.
- In terms of people with disability receiving poor treatment from other people, 56% agreed that people often make fun of disability, 62% agreed that people with disability are easier to take advantage of or exploit than other people. 60% agreed that people tend to get impatient with people with disability, but only 40% agreed that people with disability are treated as if they have no feelings.
- 61% agreed that having a disability can make someone a stronger person, and 43% agreed that it can make someone wiser. 49% agreed that some people achieve more because of their disability and 41% agreed that people with disability are more determined to reach their goals.
- Only 5% of respondents agreed that sex should not be discussed with people with disability. In terms of the prospects for the future for people with disability, 14% agreed that people should not expect too much from people with disability, 6% agreed that people with disability should not be optimistic about the future and 13% agreed that they have less to look forward to than people without disability.
- Attitudes to employment were fairly positive, with 60% agreeing that employing people with disability improves a company's image. Only 3% agreed that people with disability do not want to work and 14% agreed that they work less efficiently than people without any disability. A large majority of respondents (89%) agreed that it's easier for people with disability to do their job if they have the right support and equipment at work.

Table 3 Attitudes to people with disability, Power scale individual items, Australia, 2022 (%)

	Strongly agree (%)	Agree (%)	Neither agree nor disagree (%)	Disagree (%)	Strongly disagree (%)
Inclusion					
People with disability find it harder than others to make new friends	9.0	43.8	33.3	11.8	2.1
People with disability have a hard time getting involved in society	8.6	49.6	28.6	11.4	1.9
People with disability are burden on society	1.0	5.1	16.4	37.7	39.8
People with disability are a burden on their family	1.6	14.9	31.7	30.7	21.1
Discrimination					
People often make fun of disability	10.2	45.8	25.1	15.6	3.3
People with disability are easier to take advantage of	12.6	48.6	27.2	8.9	2.7
People tend to become impatient with those with disability	9.5	51.1	26.5	11.2	1.7
People tend to treat those with disability as if they have no feelings	6.8	33.5	30.3	24.7	4.8
Gains					
Having a disability can make someone a stronger person	12.4	48.7	31.6	6.0	1.3
Having a disability can make someone a wiser person	8.0	34.8	44.5	10.1	2.6
Some people achieve more because of their disability	8.7	39.8	38.7	10.5	2.4
People with disability are more determined to reach their goals	8.1	33.4	52.2	5.3	1.0
Prospects					
Sex should not be discussed with people with disability	1.9	3.4	21.5	41.4	31.9
People should not expect too much from those with disability	1.9	12.1	30.3	40.0	15.7
People with disability should not be optimistic (hopeful) about their future	1.8	4.2	10.8	40.5	42.7
People with disability have less to look forward to than others	1.6	11.3	24.4	40.7	22.0
Work					
Employing people with disability improves a company's image	12.0	47.7	33.5	5.3	1.4
People with disability do not want to work, they do not look for a job	1.1	2.0	16.9	44.3	35.7
People with disability work less efficiently than people without any disability	1.7	12.5	33.5	37.8	14.5
It is easier for people with disability to do their job if they have the right support	46.0	42.8	7.5	2.3	1.5

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

Australians have the most positive attitudes towards people with disability in the domains of prospects and work and the least positive attitudes in the domains of discrimination and gains (Figure 1). The statements in the discrimination domain are different from the others because they are not specifically asking about the respondents' own attitudes, but rather their perceptions of other people's attitudes. This could explain why, overall, it is less positive than the others. It could be that people think their own attitudes are fairly positive, but are aware that other people might discriminate against people with disability.

The differences between the five domains are all statistically significant at the 95% confidence level. For each domain, the mean score on the 1–5 scale is above 3, meaning that, overall, attitudes towards people with disability are more positive than negative.

Figure 1 Attitudes to people with disability, Australian adult population, 2022, mean scores

Notes: The 'error bars' on each bar indicate the 95% confidence intervals for the estimate.
 Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

4.2.1 Attitudes to disability by disability status

People with a disability themselves have more positive attitudes about disability than people who do not have a disability in relation to inclusion, discrimination, gains and work. However, those with disability had more negative views about the prospects for people with disability. In other words, people with disability reported lower optimism and future prospects and believed that people underestimate them (Figure 2).

These results are different from the data from the vignettes (Section 5) and the modules for people with disability and people with hiring responsibilities (Section 6), which highlighted more of the poor treatment of people with disability in the workplace and the barriers to work.

Figure 2 Attitudes to people with disability by whether respondent has a disability, Australian adult population, 2022, mean scores

Notes: The 'error bars' on each bar indicate the 95% confidence intervals for the estimate.
 Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

4.2.2 Attitudes to disability by sector and hiring responsibilities

This section presents some of the attitudes of workers in the key sectors and people with hiring responsibilities towards people with disability relating to the five domains - Inclusion, Discrimination, Gains, Prospects and Work (Figures 3 and 4). Some of the key findings are:

- More people in personal and community support agreed that people with disability find it harder than others to make new friends (58%) and have a hard time getting involved in society (65%) relative to other key sectors.
- In terms of being a burden, there was little difference in attitudes between sectors, with very few agreeing that people with disability are a burden on society (although the rate for health workers was slightly higher than the others). There was more variation in the rates of agreeing that people with disability are a burden on their families (health 16%, justice and legal 14%, personal and community support 11% and education 13%).
- The attitudes across the four Discrimination statements show similar variations between sectors, with the lowest levels of agreement or strong agreement with the statement that people tend to treat people with disability as if they have no feelings.
- Similarly, there are only very small differences between sectors across all the remaining attitude domains (Gains, Prospects and Work).

- There are almost no differences between respondents with or without hiring responsibilities across the whole Power scale.⁹

Figure 3 Attitudes to people with disability by sector, Australia, 2022, mean scores

Notes: The 'error bars' on each bar indicate the 95% confidence intervals for the estimate.
 Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

⁹ Those with hiring responsibilities indicated marginally better attitudes by about 0.6%. Even though this difference is marginal, the difference is statistically significant at 5% confidence interval.

Figure 4 Attitudes to people with disability by whether respondent has hiring responsibilities, Australia, 2022, mean scores

Notes: The ‘error bars’ on each bar indicate the 95% confidence intervals for the estimate.

Source: Australia’s Disability Strategy Survey – *Share with us*, 2022.

4.2.3 Attitudes to disability by experience with disability

Section D of the ADS Survey, ‘Own experience with people with disability’, was designed to identify those who had engaged with people with disability in a number of ways. These included providing paid care, providing unpaid care, help or assistance, having ever lived with someone with disability and having ever had one of the following:

- a) Close family member with disability (such as your parents, children or a sibling)
- b) Partner with disability
- c) Close friend with disability
- d) Work colleague with disability
- e) Boss or work supervisor with disability
- f) Teacher or lecturer with disability
- g) Classmate with disability.

Respondents who answered yes to any of these were categorised in the analysis as having experience with people with disability.

Those who had experience with people with disability had more positive attitudes relative to those who did not have experience in all five domains: inclusion, discrimination, gains, prospects and work (Figure 5). This is consistent across all the survey data, including the vignettes (see Section 5).

Figure 5 Attitudes to people with disability by whether respondent has experience with disability, Australia, 2022, mean scores

Notes: The 'error bars' on each bar indicate the 95% confidence intervals for the estimate.

5 Attitudes to disability in context: The vignettes

An alternative way to assess attitudes to disability is the use of vignettes. A vignette is a short description of a situation or scenario which respondents are asked to respond to. In order to understand how attitudes might differ according to the type of disability, the type of disability is varied randomly across survey respondents. This randomisation provides insights into how attitudes towards disability vary according to the type of disability. This approach is sometimes described as a survey experiment. For example:

Imagine a close relative is in a relationship with a person with a physical disability, such as reduced mobility or movement.

How comfortable or uncomfortable would you feel?

- 1 Very comfortable
- 2 Fairly comfortable
- 3 Fairly uncomfortable
- 4 Very uncomfortable

The types of disabilities, how they are described and the relative allocations are:

- a sensory or communication impairment, such as being partially or fully blind or deaf [25% of the sample]
- a physical disability, such as reduced mobility or movement [25% of the sample]
- a psychosocial condition, such as severe anxiety or depression [25% of the sample]
- a neurological disability, such as autism or ADHD [12.5% of the sample]
- an intellectual disability, such as Down syndrome [12.5% of the sample].

In total there were 13 vignettes. The first three were presented to all respondents. Respondents from the four key sectors and people with hiring responsibilities were presented with an additional two vignettes. This means that a person could be presented with anywhere between 3 and 7 vignettes. Respondents were randomly allocated to one of the five disability categories.

Some of the responses to the vignettes are quite surprising and are likely to be due to mixed levels of understanding of the nature and effects of different types of disability.

5.1 Vignette – Relationship

All respondents were asked how comfortable they would feel about a close family member being in a relationship with someone with a disability. Across the whole sample, most people were fairly comfortable or very comfortable with a close family member being in a relationship with someone with disability (ranging from 76%–91%), and very few people were very uncomfortable (between 1% and 3%). There are substantial differences between categories of disability, with 22% being fairly or very uncomfortable with respect to intellectual disability and 24% with respect to psychosocial disability. Slightly more people with disability were fairly comfortable or very comfortable across all disability categories.

Table 4 Imagine a close relative is in a relationship with a person with a [...] disability. How comfortable or uncomfortable would you feel? Australian population aged 18 years plus

	Nature of disability				
	Sensory	Physical	Psychosocial	Neurological	Intellectual
Very comfortable (%)	44.2	47.1	23.3	38.6	24.4
Fairly comfortable (%)	46.1	43.9	52.9	48.4	53.6
Fairly uncomfortable (%)	8.7	7.6	21.7	11.7	18.8
Very uncomfortable (%)	1.0	1.5	2.2	1.3	3.2

Source: Australia's Disability Strategy Australia – *Share with us*, 2022.

People with experience of disability were more comfortable than those without experience across all disability categories (Appendix Table 6A), while there were only minimal differences between respondents with or without hiring responsibilities (Appendix Table 7A).

Responses from the four key sectors were very similar to the sample-wide results, except for justice and legal, where more were uncomfortable with physical disability (16.3%) and fewer were uncomfortable with psychosocial disability (9%) (Appendix Table 8A).

5.2 Vignette – General practitioner

When participants were asked if they agreed or disagreed that they would get the same quality of treatment as from a doctor/general practitioner (GP) without disability, responses were quite different, depending on the category of disability (Table 5). For physical disability, 94.0% agreed that they would get the same level of treatment. This compares to 81.9% for neurological disability, 72.6% for psychosocial and 69.2% for sensory, down to 60.4% who agreed that they would get the same quality of treatment from a GP with intellectual disability. The fact that 6 in 10 people think that they would get the same quality of treatment from a doctor with an intellectual disability is quite surprising and perhaps reflects a lack of understanding of either what having an intellectual disability means or what is required to provide high quality medical care.

Responses from those with and without disability are very similar, with those with disability slightly more likely to disagree that they would get the same quality of treatment (Appendix Table 9A). The same pattern is evident for those both with and without experience of disability and with or without hiring responsibilities (Appendix Tables 10A and 11A).

Table 5 Imagine your doctor (GP) has a [...] disability. Do you agree or disagree that they would give you the same quality of treatment as a doctor without these conditions? Australian population aged 18 years plus

	Nature of disability				
	Sensory	Physical	Psychosocial	Neurological	Intellectual
Strongly agree (%)	27.1	66.7	31.3	38.9	23.4
Somewhat agree (%)	42.1	27.3	41.3	43.0	37.0
Somewhat disagree (%)	24.0	5.0	21.5	14.1	28.6
Strongly disagree (%)	6.8	1.0	5.9	4.0	10.9

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

There were some interesting differences between the attitudes of workers in the key sectors. Only 54% of health workers agreed that they would get the same quality of treatment from a GP with intellectual disability, compared to 72% in justice and legal, 66% in personal and community support and 64% in education. More workers in justice and legal than other sectors thought that a physical disability would affect the quality of treatment. Otherwise, the patterns are similar across sectors (Appendix Table 12A).

5.3 Vignette – Boss

All respondents were asked about how comfortable or uncomfortable they would feel working for a boss with [...] disability. Only 5% said they would be fairly or very uncomfortable having a boss with physical disability, but this went up to 12% for sensory, 21% for neurological, 29% for intellectual and 32% for psychosocial disability (Table 6).

Table 6 Imagine your boss has a [...] disability. How comfortable would this make you feel? Australian population aged 18 years plus

	Nature of disability				
	Sensory	Physical	Psychosocial	Neurological	Intellectual
Very comfortable (%)	35.7	60.3	19.3	28.1	22.0
Fairly comfortable (%)	51.6	35.5	48.8	50.8	49.4
Fairly uncomfortable (%)	11.4	3.5	28.7	18.9	24.8
Very uncomfortable (%)	1.3	0.7	3.2	2.2	3.8

Notes: The question included the additional instruction 'If you are currently not working, think about how you would feel in this situation'.

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

Responses did not vary much between respondents with or without disability (Appendix Table 13A) or those with or without hiring responsibilities (Appendix Table 14A). However, those with experience of people with disability were less likely to be uncomfortable than those without experience (Appendix Table 15A).

Responses were similar across the four key sectors, except that in the justice and legal sector, workers were more likely to feel uncomfortable (30%) about a boss with intellectual disability relative to other key sectors. More specifically, 22.3% in health care, 25% in personal and community support and 23% in education (Appendix Table 16A).

5.4 Vignettes – Health

Workers in the health sector were asked if they agreed or disagreed that a patient should be able to make their own decisions about treatment. The vast majority agreed that people with disability should be able to make their own decisions about treatment (Table 7). The breakdown by disability type was: sensory – 95.9%, physical – 98.7%, psychosocial – 84.4%, neurological – 86.4% and intellectual – 91.8%.

The major differences were in the numbers who disagreed that people with particular disabilities should be able to make treatment decisions. While the numbers were very small for sensory and physical disability, rates of disagreement were higher for intellectual (8.2%), neurological (13.6%) and psychosocial (15.6%) disabilities. This may partly explain why many people with certain types of disabilities report that they feel excluded from decision-making.

Table 7 Imagine a patient has a [...] disability. Do you agree or disagree they should be able to make their own decisions about treatment? Health sector workers

	Nature of disability				
	Sensory	Physical	Psychosocial	Neurological	Intellectual
Strongly agree (%)	81.2	82.3	34.2	49.7	33.1
Somewhat agree (%)	14.7	16.4	50.1	36.8	58.7
Somewhat disagree (%)	3.1	1.4	13.3	12.1	8.1
Strongly disagree (%)	1.0	0.0	2.4	1.5	0.1

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

Workers in the health sector were also asked if they agreed or disagreed that a person with a disability should be able to access the same range of fertility or family planning services as people without disability. They overwhelmingly agreed that people with disability, particularly sensory or physical disability, should be able to access the same range of fertility or family planning services as people without disability (Table 8). However, there was more disagreement about access to these services for people in the other disability categories, psychological (12.8%), neurological (8.8%) and intellectual (10.1%).

Table 8 Imagine a patient has a [...] disability. Do you agree or disagree they should be able to access the same range of fertility or family planning services as people without disability? Health sector workers

	Nature of disability				
	Sensory	Physical	Psychosocial	Neurological	Intellectual
Strongly agree (%)	83.2	72.5	54.0	56.1	33.5
Somewhat agree (%)	14.5	24.1	33.2	35.2	56.4
Somewhat disagree (%)	1.4	3.3	10.8	5.7	6.5
Strongly disagree (%)	0.9	0.1	2.0	3.0	3.6

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

5.5 Vignettes – Justice and legal sector

Workers in the justice and legal sector were asked if they agreed or disagreed that a person with a disability is likely to be believed if they report abuse. While the majority of workers in this sector agreed that people with disability are likely to be believed if they report abuse, there were variations depending on the category of disability (Table 9). The responses were generally more positive when it came to believing people with physical (89%) and sensory (81%) disabilities reporting abuse, than for those with intellectual (77%), neurological (75%) and psychosocial (70%) disabilities. It is interesting that the lowest rates of agreement and the highest rates of disagreement (at 30.2%) related to people with a psychosocial condition, such as severe anxiety or depression.

Table 9 Imagine a person has a [...] disability. Do you agree or disagree they are likely to be believed if they report abuse? Justice sector workers

	Nature of disability				
	Sensory	Physical	Psychosocial	Neurological	Intellectual
Strongly agree (%)	25.1	48.5	22.3	28.7	28.2
Somewhat agree (%)	55.6	40.0	47.5	45.9	48.7
Somewhat disagree (%)	14.4	11.6	28.5	24.8	18.4
Strongly disagree (%)	4.8	0.0	1.6	0.6	4.8

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

The majority of justice and legal sector workers felt comfortable engaging with a person with disability who had stolen something from a shop (Table 10). Once again, there were differences between disability types, with more workers comfortable engaging with people

with physical disability (70.9%) compared to engaging with people with psychosocial disability (56.9%). This is much more positive than the responses from people with disability describing their experiences with the justice and legal sector would suggest (See Section 6.1).

Table 10 Imagine a person has a [...] disability stole something from a shop. How comfortable or uncomfortable would you be dealing with this? Justice and legal sector workers

	Nature of disability				
	Sensory	Physical	Psychosocial	Neurological	Intellectual
Very comfortable (%)	19.9	30.8	9.3	35.0	24.4
Fairly comfortable (%)	47.6	40.1	47.6	28.6	37.9
Fairly uncomfortable (%)	23.0	29.1	35.5	33.2	36.4
Very uncomfortable (%)	9.6	0.0	7.7	3.2	1.2

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

5.6 Vignettes – Personal and community support sector

Workers in the personal and community support sector were asked if they agreed or disagreed that a person with disability should be able to access the services their organisation provides if they are eligible (Table 11). The vast majority of workers in the sector agreed, with the highest level of agreement related to sensory disability (99.1%) and the highest level of disagreement related to intellectual disability (6.1%).

Table 11 Imagine a person has a [...] disability. Do you agree or disagree they should be able to access the services your organisation provides if they are eligible? Personal and community support sector workers

	Nature of disability				
	Sensory	Physical	Psychosocial	Neurological	Intellectual
Strongly agree (%)	86.2	90.8	76.5	83.3	91.3
Somewhat agree (%)	12.9	5.0	20.9	14.3	2.6

Strongly disagree (%)	0.0	0.0	0.0	0.0	0.8

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

Similarly, most personal and community support sector workers agreed that people with disability should be able to communicate directly with a service provider rather than through someone else (Table 12). In this case, the highest levels of agreement related to people with neurological disability (100%) and physical disability (96.8%) and the highest levels of disagreement related to people with psychosocial disability (11.3%).

Table 12 Imagine a person has a [...] disability. Do you agree or disagree they should be able to communicate directly with a service provider, rather than through someone else? Personal and community support sector workers

5.7 Vignettes – Education

When asked if students with disability should attend sex education classes with their peers, most education sector workers agreed across all the disability categories (Table 13). The lowest rates of agreement related to people with psychosocial disability (90.4%).

DRAFT

Table 13 Imagine a teenager has a [...] disability, Do you agree or disagree they should attend sex education classes with their peers? Education sector workers

Strongly disagree (%)	1.0	1.3	2.0	0.0	0.4

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

In addition, most education sector workers disagreed that students with disability should be excluded from activities like basketball (Table 14). Of those who agreed they should be excluded, the highest rate was for sensory disability (14.5%). Interestingly, the lowest rates of agreement that they should be excluded related to people with psychosocial (7.4%) and intellectual disability (6.9%).

Table 14 Imagine a young person has a [...] disability. Do you agree or disagree they should be excluded from activities such as basketball? Education sector workers

	Nature of disability

5.8 Vignettes – Hiring responsibilities

Workers with hiring responsibilities were asked if a business should hire people with disability if they have experience and can physically do the job. The vast majority, more than 90%, agreed with this across all disability categories (Table 15). Again, this is much more positive than the experience of people with disability would suggest.

Table 15 Imagine a person has a [...] disability. Do you agree or disagree that a business should employ them if they have the experience and can physically do the job?

	Nature of disability				
	Sensory	Physical	Psychosocial	Neurological	Intellectual
Strongly agree (%)	73.2	83.7	56.9	72.6	69.3
Somewhat agree (%)	23.0	14.8	36.2	24.4	26.4
Somewhat disagree (%)	2.8	1.4	5.7	1.7	2.2
Strongly disagree (%)	1.1	0.1	1.2	1.4	2.2

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

There were equally strong levels of agreement that a business should provide the support and training required to help people with disability to get promoted (Table 16). This aligns with the high rate of agreement to item (t) in the power scale (See Section 4.2) about providing support and equipment.

Table 16 Imagine a person has a [...] disability. Do you agree or disagree that a business should provide the support and training required to help them get promoted?

6 Experiences of people living with disability

Attitudes and behaviours towards disability that people profess are important. However, the experience of people with disability is also very important and understanding that experience may also help to shape sound policy and service responses. The ADS Survey included a number of questions for people living with disability about their experiences and the extent to which attitudes of others create barriers to their full social and economic participation.

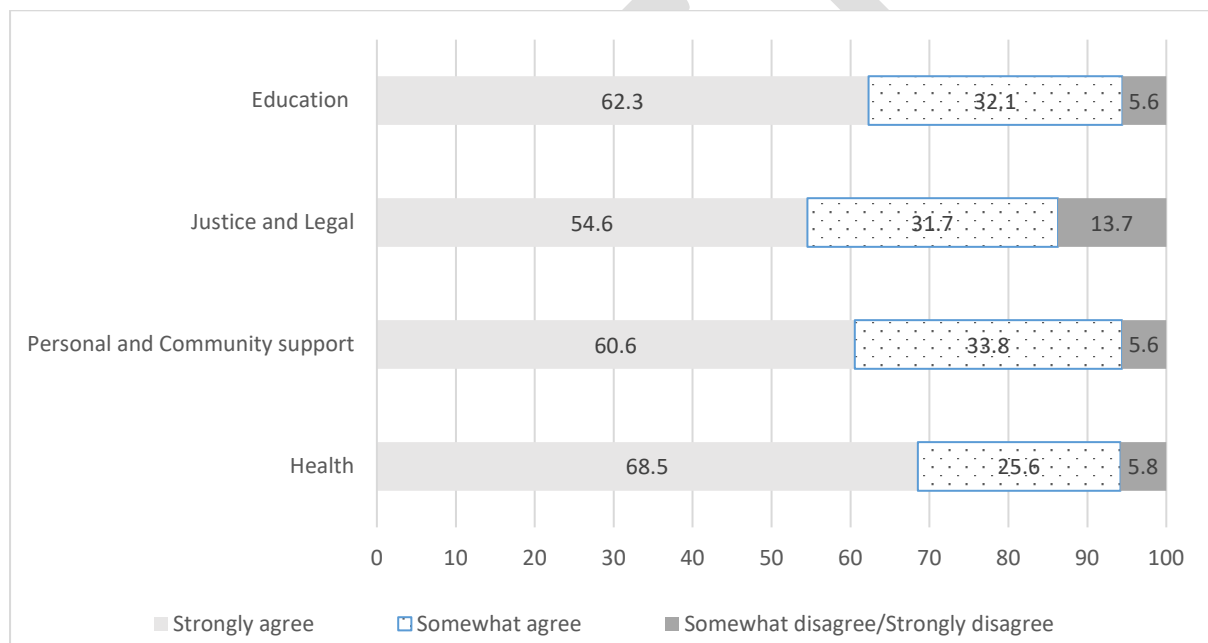

6.1 Experience with workers in the key sectors

The ADS Survey first asked people with disability whether they had contact with the health care, residential care, social or community, legal services, public order and safety and education sectors in the last 12 months. Those who reported having had contact with workers in these sectors in the last 12 months were then asked about their experience. If they had contact with more than one sector over the previous 12 months they were then asked about their experience with workers in the sector that they had the most recent contact with.

Most people with disability reported using health services in the last 12 months (87.4%), followed by education (25.7%), social and personal and community support (20.7%), residential care (7.6%), and legal services (12.7%). Just 4.9% reported contact with workers in public order and safety in last 12 months. To maintain consistency throughout the report, these six groups were collapsed into the four key sectors using the method outlined in section 3.

The vast majority of people with disability agreed that they were treated with respect by workers in the key sectors. The proportion of respondents reporting they strongly agree that they were treated with respect was around two-thirds for all sectors, except for the justice and legal sector, for which 54.6% strongly agreed that they were treated with respect (Figure 6). The proportion who disagreed that they were treated with respect was relatively low (around 6%) except for experiences with workers in justice and legal sector, with 13.7% disagreeing that they were treated with respect.

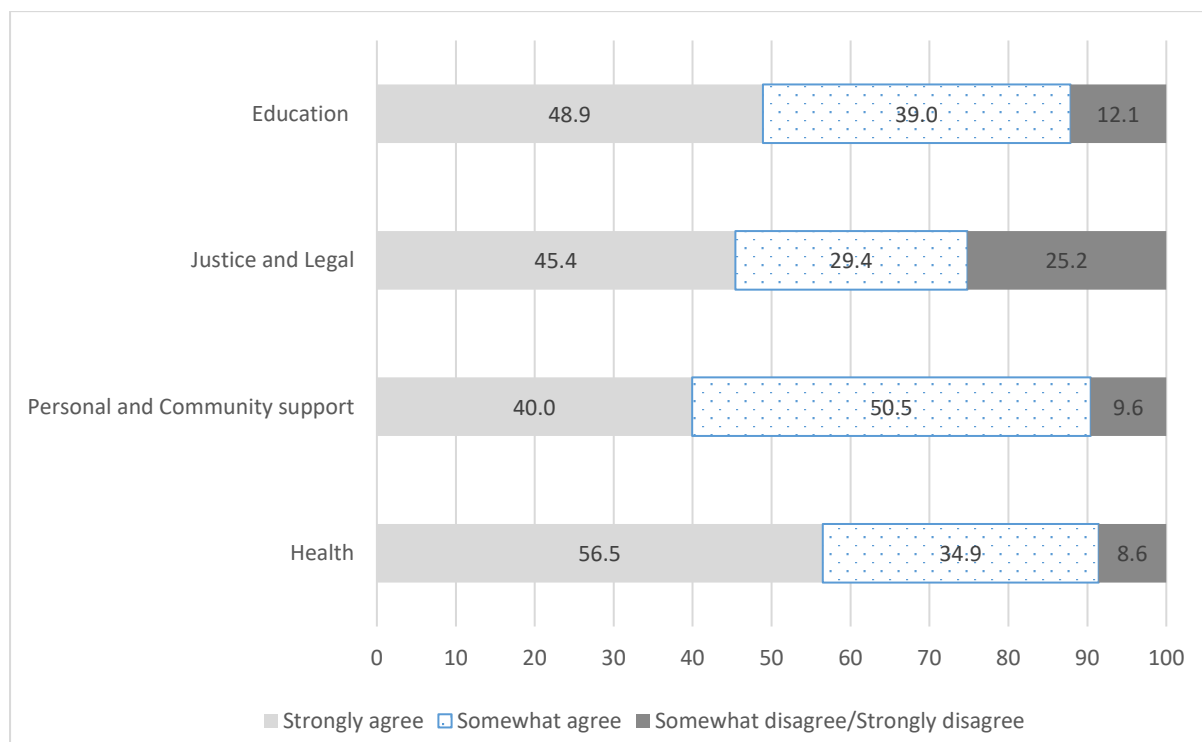

Figure 6 Treated with respect by workers in key sectors, people with disability (%)

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

In terms of having things explained clearly, the proportion who agreed was again high (between 88% and 92%), except for workers in the justice and legal sector (74.8%) (Figure 7).

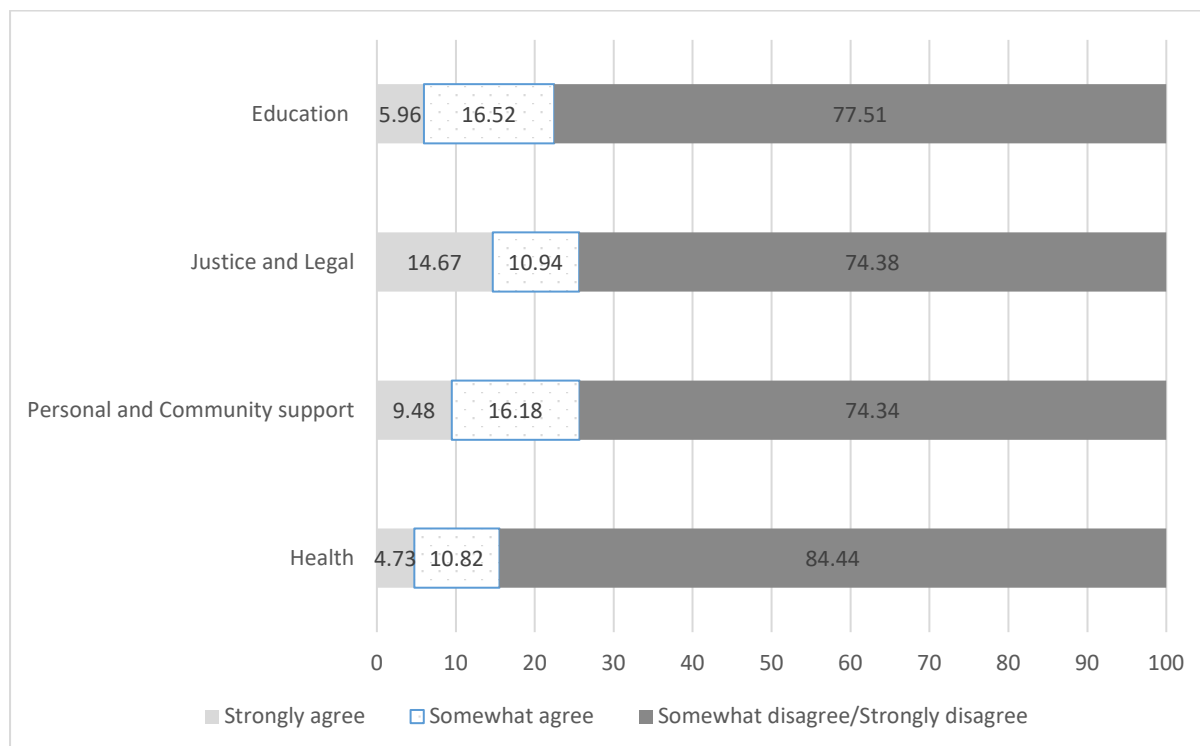

Figure 7 Things were explained to me clearly by workers in key sectors, people with disability (%)

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

While the majority of people with disability did not think that they would have been treated better if they did not have a disability, a substantial minority agreed that they would have been treated better (Figure 8). This ranged from 15.6% in relation to health services to 25.6% in the justice and legal sector.

Figure 8 I would have been treated better if I did not have a disability by workers in key sectors, people living with disability (%)

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

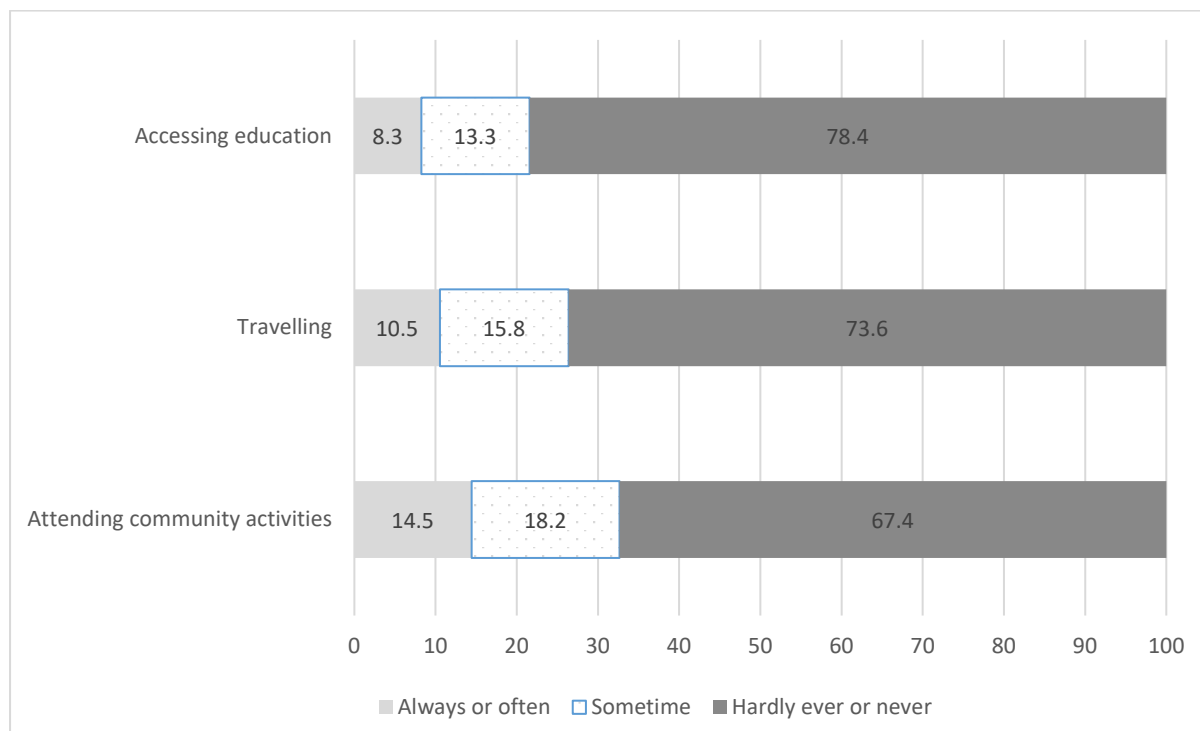

6.2 Experience in the broader community

Restricted by other people's attitudes

In the context of people with disability or long-term health conditions experiencing unfair treatment, bullying or discrimination, respondents with disability were asked if other people's attitudes or behaviours ever stopped them from accessing or undertaking various activities, including attending community activities, travelling and accessing education.

While the majority of people with disability said that other people's attitudes hardly ever or never limited their ability to attend community activities, travelling or accessing education, a substantial minority said they were limited by other people's attitudes (Figure 9). This ranged from 32.7% for attending community activities and 26.3% for travelling to 21.6% for accessing education.

Figure 9 Have other people’s attitudes prevented you from ..., people with disability (%)

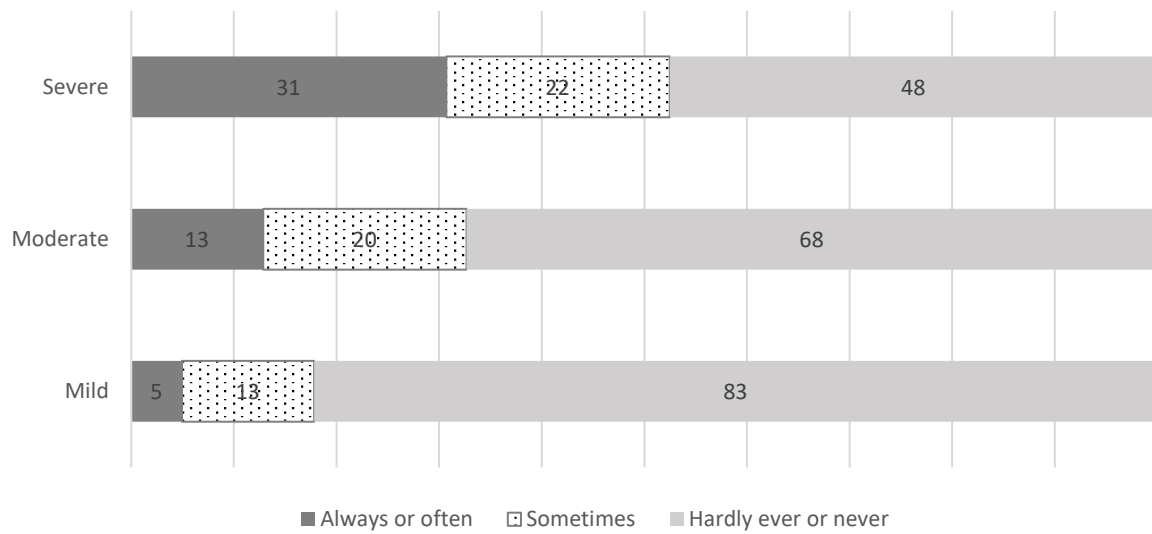

Source: Australia’s Disability Strategy Survey – *Share with us*, 2022.

In this analysis, the level of severity is based on the level of severity reported by respondents who self-identified as having a disability or long-term condition¹⁰. There is clear evidence that people with more severe disabilities are more restricted in participation by the attitudes of others. The proportion who are always or often prevented from attending community events by other’s attitudes is 5% for people with a mild disability, 13% for those with a moderate disability and 31% of those with a severe disability (Figure 10). There are also similar relationships between severity of disability and being restricted by other people’s attitudes from travelling and accessing education (Figures 11 and 12).

¹⁰ (DUM_DIS == 1).

Figure 10 Have other people’s attitudes prevented you from attending community events, by severity of disability (%)

Figure 12 Have other people's attitudes prevented you from accessing education, by severity of disability (%)

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

DRAFT

There is also evidence that the impact of other people’s attitudes on the ability of people with disability to participate in community events, travelling and accessing education varies with the nature of disability.

The attitudes of others have a smaller impact on participation by people with a sensory disability (hearing or sight) or a physical disability, and a larger impact on those with speech, intellectual, learning, and neurological disabilities (Figures 13, 14 and 15).

Figure 13 Have other people’s attitudes prevented you from attending community events, by nature of disability (%)

Notes: The number of respondents with each type of disability are 145 intellectual, 1,061 neurological, 554 learning, 1,609 physical, 778 sight, 1,507 hearing, 269 speech, 2,335 psychosocial and 331 brain injury¹¹.

Telling people you have a disability

The issue of 'invisible disability' was partly addressed by the question about whether other peoples' attitudes or behaviours stopped respondents from telling people they have a disability. Overall, only 58% of people with disability reported that they were never or hardly ever affected, with 10% of people with mild, 22% with moderate and 35% with severe disability reporting people's attitudes or behaviours always or often stopped them from disclosing their disability (Appendix Table 17A).

Whether valued and respected in community

The survey included a question about the extent to which people living with disability feel valued and respected in their community. This is a good measure of inclusion. Overall, just over one-half (54%) of people with a disability reported feeling valued and respected in their community always or often, 32% sometimes and 13% hardly ever or never felt valued and respected in their community.

The extent to which people with disability feel valued and respected in their community decreases as severity of disability increases. For those with a mild disability, 67% always or often feel valued and respected in their community. This decreases to 54% for those with a moderate disability and 38% for those with a severe disability (see Figure 16).

The survey also included a question on how often people feel included in and welcomed by their community. The pattern of responses was very similar to the question on feeling valued and respected. Again, just over half of respondents (56%) always or often felt included in and welcomed by their community (Table 17). For those with a mild disability, 69% always or often feel included and welcomed. This decreased to 55% for those with a moderate disability and 41% for those with severe disability.

Table 17 In general, how often do you feel included in and welcomed by your community? by severity of disability (%)

	Mild	Moderate	Severe	Total
Always (%)	28.0	21.7	15.7	22.3
Often (%)	40.7	33.6	25.5	33.8
Some of the time (%)	23.8	35.2	36.4	32.0
Hardly ever (%)	5.1	7.5	16.3	8.8
Never (%)	2.5	2.0	6.2	3.1

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

Finally, respondents were asked if people with disability are well represented in various spheres of life and, in this case, there were minimal differences related to the severity of the respondent's disability. The levels of agreement varied: 45% agreed that they are well represented in the community, 35% in the media, 32% in the workplace and only 19% in leadership roles. Across all disability types, more people felt well represented in the workplace and the community, but fewer in the media and in leadership roles, down to 13.7% of those with neurological and 16.1% psychosocial disorders (Appendix Table 18A).

Figure 16 Thinking about your life in general, do you feel valued and respected in your community? People living with disability (%)

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

6.3 Disability and paid employment

There is a very large gap in the rate of paid employment of people with disability compared to people without disability. In 2018, just over half of people with disability were in the labour force (53.4 %), compared with 84.1% of people without disability (ABS 2018: Table 7.1). Therefore, increasing the employment of people with disability is a high priority. There is clear evidence that the behaviours and attitudes of employers affect whether people with disability are able to find and sustain employment. The survey included specific questions for people who have hiring responsibilities and questions for people with disability about whether other people's behaviours and attitudes had affected their labour market participation.

6.3.1 Employers' perspectives

Respondents with hiring responsibilities were asked a series of questions about employing people with disability. Overall, 86.6% agreed that hiring people with disability benefits their workplace and 92.5% agreed that hiring people with disability would make a valuable contribution to their workplace. There was little variation between the key sectors, although the personal and community support sector had the highest agreement rates for both questions (Figure 17 and Appendix Tables 19A – 20A).

Figure 17 People with hiring responsibilities: Views about 'value' of employees living with disability (%)

Source: Australia's Disability Strategy Survey – *Share with us*, 2022.

Those with hiring responsibilities were then asked if they had ever been involved in hiring a person with disability. Overall, 14.6% had done so in the last year, 15.0% had, but more than a year ago, and 70.3% had never been involved in hiring someone with a disability. In the personal and community support sector, 43.9% had never hired someone with disability, but this rose to 68.1% in justice and legal, 73.5% in health, and 73.7% in education.

Respondents with hiring responsibilities were also asked if certain things would be a major challenge, a minor challenge or not a challenge to their workplace employing someone with disability. *Lack of knowledge about people with disability* was seen as a major challenge by 20.6%, a minor challenge by 50.3% and not a challenge by 29.0% (Table 18). Broken down by sector, in the justice and legal sector it was seen as a major challenge by 20.8%, a minor challenge by 56.7% and not a challenge by 22.5%. In contrast, only 12.2% of personal and community support workers saw it as a major challenge, 33.1% a minor challenge and 54.8% not a challenge.

Attitudes of co-workers were not seen as a challenge by almost half of respondents with hiring responsibilities (47.4%), with 11.5% seeing it as a major challenge and 41.2% a minor challenge. There was little variation by sector, although slightly more respondents in personal and community support (53.8%) and education (55.3%) said it was not a challenge. *Attitudes of managers* were also not seen as a challenge by almost half of respondents with hiring responsibilities (48.9%), with roughly the same breakdown by sector.

Attitudes of clients (also includes patients, student) were seen as a major challenge by 16.0%, a minor challenge by 41.3% and not a challenge by 42.7%. Justice and legal sector workers were almost twice as likely (20.4%) than workers from the other sectors to see the attitudes of clients a major challenge, but were also the most likely not to see them as a challenge at all.

Confidence engaging with people with disability was seen as a major challenge by 12.9%, a minor challenge by almost one-half (49.5%) and not a challenge by 37.7%. Only 27.1% of justice and legal sector workers with hiring responsibilities did not see confidence as a challenge to employing people with disability. It was not seen as a challenge by 36.6% in education, 41.6% in health and 51.3% in the personal and community support sector.

The unknown and actual cost to set up the workplace for people with disability yielded very similar responses, with 23.0% seeing not knowing the cost as a major challenge, 43.4% a minor challenge and 33.5% not seeing it as a challenge. For the actual cost, 24.0% saw it as a major challenge, 43.2% a minor challenge and 33.0% did not see it as a challenge. The results were fairly consistent across sectors, with the major difference being in the justice and legal sector, where only 35.1% said not knowing the cost was not a challenge, but the actual cost was not a challenge for 36.7%. This is interesting when compared with Item t in the Power scale: 'A massive 89% of respondents agreed that it's easier for them to do their job if they have the right support and equipment at work.'

You cannot find qualified people with disability was not seen as a challenge by only 23.8% of respondents with hiring responsibilities, with 34.4% seeing it as a major challenge and 41.8% as a minor challenge. In the justice and legal sector, only 13.1% did not see that as a challenge, lowest among the key sectors.

The nature of the work is such that it cannot be done by people with disability was seen as a major challenge by a quarter (25.8%) of respondents and as a minor challenge by 39.9%. Just over a third (34.3%) did not see it as a challenge. However, there were differences between sectors. It was seen as a major challenge by 33.4% of health workers, but only by 12.1% in personal and community support, 10.7% in justice and legal, and 16.9% in education.

Table 18 People with hiring responsibilities: Barriers experienced by people with disability in the workplace (%)

	Sector				Total

6.3.2 Impact of community attitudes on the employment of people with disability

People with disability were asked whether other people’s attitudes or behaviours have ever stopped them from trying to get a job, get a promotion, get a better job or keep a job. Because the response patterns were similar across all three employment outcomes, the data presented here only relates to the impact of attitudes and behaviours on trying to get a job. Results for trying to get a promotion and keeping a job are presented in the Appendix Tables 21A-23A).

Overall 67.2% of people with a disability said that other peoples’ attitudes or behaviours never or hardly ever stopped them from *trying to get a job*, 16.1% said sometimes and 16.8% said always or often. Looking at how the severity of disability influenced the results, 82.1% of people with mild disability, 66.6% with moderate disability and 48.2% with severe disability said other people’s attitudes had hardly ever or never prevented them from trying to get a job (Figure 18). This indicates that almost half of people with severe disability were put off trying to get a job because of the attitudes or behaviours of others.

Figure 18 Have other people’s attitudes prevented you from trying to get a job, by severity of disability (%)

7 Conclusion

This report describes key findings from the first wave of the ADS Survey – *Share with us* conducted in 2022. The survey looks at attitudes in the general community (including people with disability), the attitudes of workers in the four sectors identified as key during the widespread consultations people with disability to support the development of the ADS and employed people with hiring responsibilities. The key sectors identified were: health, justice and legal, education and personal and community support. Additional results and data on the ADS Outcomes Framework are published on [Community attitudes - Australian Institute of Health and Welfare \(aihw.gov.au\)](https://www.aihw.gov.au). The survey also collected quite detailed information on the experiences of people with disability and how they are affected by the attitudes and related behaviours of others.

Overall, most Australians report having fairly positive attitudes towards people with disability. Based on the responses to a series of questions about attitudes towards people living with disability (the Power scale), Australians have the most positive attitudes towards people with disability in the domains of prospects and work and the least positive attitudes in the domains of discrimination and gains. A key finding is that people with experience of people with disability had more positive attitudes towards and were more confident engaging with people with disability. People who themselves have disability also had more positive attitudes towards people with disability than do other Australians.

Attitudes of workers in the four key sectors were compared using the data from the Power scale. There were only small differences between the sectors, apart from agreement with the statement that people with disability are a burden on their families (health 16%, justice and legal 14%, personal and community support 11% and education 13%). There are almost no differences between respondents with or without hiring responsibilities across the whole Power scale.

The findings from the vignettes were less positive overall and attitudes varied significantly between types of disability. Some of the responses to the vignettes are quite surprising and are likely to be due to mixed levels of understanding of the nature and effects of different types of disability. For example, when asked how comfortable they felt with a close relative being in a relationship with someone with disability, respondents who were very comfortable ranged from 47.1% for physical disability down to 23.3% for psychosocial disability.

Vignettes for respondents from the four key sectors showed slightly less positive attitudes than the Power scale responses. However, there were again differences by disability type. For example, when asked if people with disability should be able to access the same range of fertility or family planning services as people without disability, health sector workers who strongly agreed ranged from 83.2% for physical disability down to 33.5% for intellectual disability.

Workers in the key sectors were asked about their '*confidence* in their *ability* to advise, assist or treat people with...' different categories of disability. A majority of respondents felt very confident or quite confident, although there were variations between sectors and types of disability. Once again, experience with disability is very important. Those who engaged with people with disability most frequently had the highest levels of confidence. Overall, 92.5% of key sector workers reported feeling very confident or quite confident that they *respond in a positive way* to people living with disability, ranging from 87.1% in the justice sector up to 98.0% in the personal and community support sector.

In terms of employment, 86.6% of those with hiring responsibilities reported that hiring people with disability benefits their workplace and 92.5% agreed that hiring people with disability would make a valuable contribution to their workplace. However, only 14.6% had hired someone with a disability in the last 12 months, 15.0% had done so but more than a year ago and 70.3% had never been involved in hiring someone with a disability. The proportion who had never hired someone with a disability ranged from 43.9% in the personal and community support sector, 68.1% in justice and legal, 73.5% in health, to 73.7% in education. Potential barriers to hiring people with disability were seen as a major challenge by a minority of respondents, but this varied between sectors and the type of barrier.

As expected, the experience of people with disability is much more complex and is affected by a range of factors, particularly the type and severity of their disability, so the survey explored that experience from a number of perspectives. Firstly, they were asked about their experience with workers from the four key sectors. The proportion of respondents reporting they agree that they were treated with respect was very high – over 94% for all sectors except the justice and legal sector (86.3%). Similarly, in terms of having things explained clearly, the proportion who agreed was between 88% and 92%, with a lower rate for the justice and legal sector (74.8%).

People with disability were then asked if other people's attitudes or behaviours ever stopped them from accessing or undertaking various activities. While the majority reported 'hardly ever' or 'never' across all the activities, the severity and the type of the disability both had a significant impact on access. For example, accessing education was the least affected by other peoples' attitudes or behaviours, with 21.6% responding that they had been stopped from accessing education always, often or sometimes. However, when broken down by severity, only 10% of people with mild disability, but 21% with moderate disability and 37% with severe disability had been stopped by other peoples' attitudes (always, often or sometimes) from accessing education. The disability types affected by the attitudes of others always or often were speech (25.6%), intellectual (22.7%) and learning (22.3%) impairments and brain injury (20.3%).

Other peoples' attitudes and behaviours had a greater impact on respondents attending community events. Overall, almost a third (32.5%) reported feeling deterred always, often or sometimes. For those with mild disability, it was only 18%, rising to 33% for those with moderate disability and to 53% for respondents with severe disability. People with neurological (37.6%), learning (36.3%) and psychosocial (33.7%) disorders were stopped from attending community events by the attitudes of others always or often

In terms of feeling valued and respected by their community, overall just over half of people with disability (54.5%) reported feeling valued and respected always or often. For those with mild disability, it was 67%, for those with moderate disability, 54% and only 38% of those with severe disability felt valued and respected always or often and, once again, there were variations by disability type. Similarly, just over one-half of respondents (56.5%) always or often felt included in and welcomed by their community: 69% with mild disability, 56% with moderate disability and only 41% of respondents with severe disability.

Finally, respondents with disability were asked if people with disability are well represented in various spheres of life and, in this case, there were minimal differences related to the severity of the respondent's disability. The levels of agreement varied with 45.4% agreeing that they are well represented in the community, 35.4% agreeing to being well represented

in the media, 31.6% agreeing to being well represented in the workplace and only 19.2% agreeing with being well represented in leadership roles.

Further analysis is required to identify the demographic and other drivers of different kinds of attitudes and what can be done to change attitudes. This baseline data and the three subsequent waves will enable monitoring of changes in community attitudes over the life of ADS and support the development of initiatives and responses designed to change attitudes and, ultimately, improve outcomes for people with disability across all ADS outcome areas.
